

# Acquisition Assistant

A platform designed to help scale the underwriting & purchases of real estate properties for a local prop-tech startup.

## The Problem

At the start, all underwriting was done through spreadsheet calculations and manually sifting through active listings.

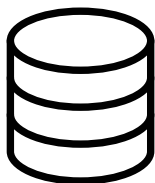

The startup was growing daily and this method was not a long-term viable solution.

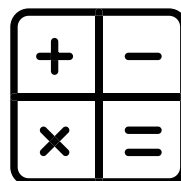

## The Solution

Track & find new active listings within target market area.

Perform underwriting for every new property.

Display to arrived properties that best fit their investment criteria.
